

Natalia Voss

Warsaw, Poland | +48 601 234 789 | natalia.voss@protonmail.com | linkedin.com/in/nataliavoss-qa

PROFESSIONAL SUMMARY

Quality engineer with nine years of progressive experience designing and maintaining automated test suites for web, mobile, and API surfaces. Background spans early-stage product companies through large-scale distributed systems, with a particular focus on shifting quality left and reducing mean-time-to-feedback in CI pipelines. Comfortable working across Python, TypeScript, and Java ecosystems, and experienced embedding QA thinking into sprint planning and architecture review.

CORE COMPETENCIES & TOOLS

Test Automation Frameworks	Selenium WebDriver, Playwright, Cypress, Appium
API & Contract Testing	Postman, RestAssured, Pact (consumer-driven contracts)
Languages	Python 3.x, TypeScript, Java 11+, Bash
CI/CD & DevOps	GitHub Actions, Jenkins, Docker, Kubernetes (basic)
Observability	Grafana, Datadog, ELK stack
Test Management	Jira Xray, TestRail, qTest
AI/ML Tooling	LangChain (RAG pipeline validation), pytest-benchmark
Methodologies	BDD (Gherkin/Cucumber), TDD, shift-left, chaos testing

PROFESSIONAL EXPERIENCE

Senior QA Automation Engineer

Lendio Solutions sp. z o.o. — Warsaw, Poland | Mar 2021 – Present

- Redesigned the end-to-end regression suite from Selenium + JUnit to Playwright + TypeScript, cutting suite execution time from 47 minutes to 11 minutes and eliminating ~340 flaky tests across three browser targets.
- Introduced contract testing (Pact) between six microservices, catching three breaking API changes in CI before they reached staging; estimated saving ≈ 12 developer-hours per incident.
- Embedded as the sole QA resource on a four-team squad during a high-priority data-migration project; defined acceptance criteria for 1,200+ data transformation rules and delivered zero critical defects at go-live.
- Mentored two mid-level engineers through a structured four-month upskilling programme; both achieved independent ownership of feature test plans within six months.
- Built a lightweight test-data generation service in Python (Faker + SQLAlchemy) that provisioned isolated database states per test run, reducing manual setup effort by ~80%.

QA Automation Engineer

Codewise (now Zeropark) — Kraków, Poland | Jun 2018 – Feb 2021

- Owned the automation strategy for a high-throughput ad-tech platform processing ~4 billion events/day; built Python-based API regression tests covering 180 endpoints.
- Integrated performance test scripts (Locust) into the nightly pipeline; identified a memory-leak regression that would have degraded throughput by ~15% under peak load.

- Reduced manual QA cycle time from 3 days to 6 hours by authoring a BDD framework (Behave + Allure) adopted across two additional teams.
- Collaborated with the SRE team to instrument smoke tests as synthetic monitors in Datadog, reducing MTTD for production incidents by an average of 22 minutes.

Junior QA / Test Analyst

Softberry Systems — Wrocław, Poland | Sep 2015 – May 2018

- Started as a manual tester on a healthcare SaaS product; transitioned to automation within 14 months by self-learning Selenium WebDriver and Java.
- Wrote and maintained ~600 regression test cases covering patient-record workflows; achieved 91% automation coverage on the critical path.
- Identified a GDPR-relevant data-exposure bug during exploratory testing six weeks before the regulation's enforcement date, preventing a potential compliance breach.

EDUCATION & CERTIFICATIONS

B.Eng. Computer Science (specialisation: Software Engineering)

Wrocław University of Science and Technology | 2011 – 2015

Thesis: Automated Regression Testing Strategies for Agile Teams

Certifications

ISTQB Advanced Level – Test Automation Engineer (2020) | AWS Certified Cloud Practitioner (2022) | Certified Scrum Master (CSM, 2019)
